Project Design Phase-II

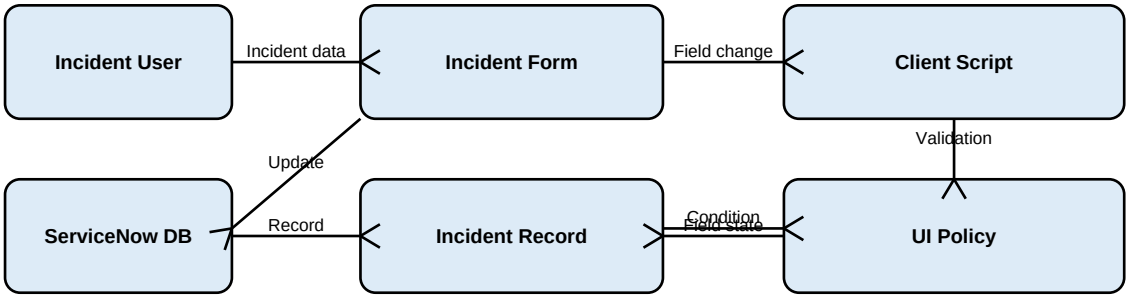
Data Flow Diagram & User Stories

Date	29 September 2026
Team ID	SWTID-2026-7872
Project Name	Implement Client Script and UI Policy (Incident)
Maximum Marks	4 Marks

Data Flow Diagrams:

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. For this project, the DFD shows how an Incident record is entered, validated, processed by Client Script and UI Policy, updated in ServiceNow, and finally stored or submitted.

Example: (Simplified)



1. User opens or creates an Incident record in ServiceNow.

2. Incident fields such as State, Category, Priority, Assignment Group and Resolution fields are entered or changed.

3. The Client Script responds to the configured form event and performs dynamic validation or field logic.

4. The UI Policy checks the configured condition and changes field states such as Mandatory, Visible or Read-only.

5. The Incident form displays the updated behavior to the user.

6. After validation, the Incident record is submitted and stored in the ServiceNow database.

User Stories

Use the below template to list all the user stories for the product.

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority
ServiceNow Administrator	Incident Form Configuration	USN-1	As an administrator, I can configure Incident form behavior using a UI Policy.	The policy applies only to the defined Incident condition and changes the selected field states.	High
ServiceNow Administrator	UI Policy	USN-2	As an administrator, I can make Incident fields mandatory when a specified condition is true.	Required fields are marked mandatory and the form prevents incomplete submission where applicable.	High
ServiceNow Administrator	UI Policy	USN-3	As an administrator, I can make selected Incident fields read-only or visible based on conditions.	Configured fields become read-only/visible according to the UI Policy condition.	Medium
ServiceNow Developer	Client Script	USN-4	As a developer, I can create an Incident Client Script for onLoad, onChange or onSubmit behavior.	The script executes for the selected Incident form event without affecting unrelated forms.	High
ServiceNow Developer	Client Script	USN-5	As a developer, I can use g_form to validate or update Incident field values dynamically.	The required field value is checked/updated and the user receives clear feedback when needed.	High
ServiceNow Developer	Testing	USN-6	As a tester, I can verify Client Script and UI Policy behavior using different Incident states and field values.	Expected behavior is confirmed for valid, invalid and boundary test cases.	High
Incident Resolver	Incident Resolution	USN-7	As a resolver, I can complete the required resolution information before resolving an Incident.	Resolution fields required by the policy are completed before successful submission.	High
ServiceNow Administrator	Deployment	USN-8	As an administrator, I can review and deploy the Client Script and UI Policy changes.	Changes are reviewed, documented and moved through the approved deployment process.	Medium
ServiceNow Administrator	Documentation	USN-9	As an administrator, I can document the conditions, actions and script logic used for the Incident form.	Configuration details are recorded for maintenance and future updates.	Low
