PROJECT DESIGN PHASE

Problem – Solution Fit Template

Date	29 September 2026
Team ID	SWTID-2026-7872
Project Name	Implement client script and UI policy (Incident)
Maximum Marks	2 Marks

Problem – Solution Fit

The Incident management problem is inconsistent and manual form handling during Incident creation and updates. Users need clear validation and automatic field behavior so important Incident information is entered consistently. The proposed solution uses ServiceNow Client Scripts and UI Policies to provide dynamic client-side behavior on the Incident form.

Customer / Target User

ServiceNow Incident users, especially service desk or support agents who create and update Incident records.

Problem Identification

• Incident forms can require different field behavior depending on the Incident state or user action.

• Manual checking can lead to missing or inconsistent information.

• Users need immediate feedback when entering or changing important Incident values.

• Fields may need to become mandatory, visible, or read-only based on defined conditions.

Solution Fit

Problem	Proposed Solution	Expected Fit
Dynamic field behavior	UI Policy controls visibility, mandatory status, and read-only behavior.	Form behavior changes automatically according to defined conditions.
Client-side validation / feedback	Client Script using JavaScript and GlideForm (g_form).	Users receive immediate form-level feedback and validation.
Resolved Incident data completeness	UI Policy makes Resolution Code and Resolution Notes mandatory when State is Resolved.	Required resolution information is prompted at the appropriate stage.
Maintainability	Separate declarative UI Policies from Client Script logic.	Changes can be managed without altering the core Incident application.

Purpose / Benefits

■ Improve consistency of Incident data entry.

■ Provide immediate client-side validation and user feedback.

■ Automatically apply field rules according to Incident conditions.

■ Reduce unnecessary manual checks by Incident users.

■ Improve the user experience while keeping the implementation within the ServiceNow platform.

Implementation Scope

Incident table, Client Scripts, UI Policies, GlideForm (g_form), and ServiceNow platform configuration.

Expected Outcome

A more consistent Incident form with dynamic validation and field behavior based on defined Incident conditions.
