PROJECT DESIGN PHASE

Proposed Solution Template

Date	29 September 2026
Team ID	SWTID-2026-7872
Project Name	Implement client script and UI policy (Incident)
Maximum Marks	2 Marks

Proposed Solution Template

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Incident users may enter incomplete or inconsistent information because field behavior and validation are not always dynamic. The project addresses the need for automatic form behavior, validation, and required-field control in the ServiceNow Incident form.
2	Idea / Solution description	Implement ServiceNow Client Scripts and UI Policies on the Incident table. Client Scripts provide client-side validation, messages, and dynamic form interaction using JavaScript/GlideForm (g_form). UI Policies control field visibility, mandatory status, and read-only behavior based on Incident conditions. Example: when an Incident is moved to Resolved, Resolution Code and Resolution Notes become mandatory.
3	Novelty / Uniqueness	The solution combines declarative UI Policies with targeted Client Script logic so common Incident form behavior is automated at the user interface level. This reduces unnecessary manual checks while keeping the implementation maintainable within ServiceNow.
4	Social Impact / Customer Satisfaction	Improves the experience of Incident users by giving immediate feedback and automatically applying appropriate field rules. Better data completeness and consistency can support clearer Incident handling and reduce avoidable data-entry errors.
5	Business Model (Revenue Model)	The solution is a ServiceNow platform customization for organizations using Incident Management. It can be delivered as part of ServiceNow implementation, configuration, customization, or support services. No separate pricing model is specified in the template.
6	Scalability of the Solution	The approach can be extended to additional Incident conditions, fields, and workflows by adding or updating UI Policies and Client Scripts. The same pattern can be applied across larger Incident-management deployments while maintaining centralized configuration.

Implementation Scope: Incident table, Client Scripts, UI Policies, GlideForm (g_form), and ServiceNow platform configuration.

Expected Outcome: A more consistent Incident form with dynamic validation and field behavior based on defined Incident conditions.
